## INSTRUCTIONS FOR MEASURING TYPICAL WHITETAILED DEER

All measurements must be made with a 1/4 inch flexible steel tape to the nearest one-eighth of an inch. Wherever it is necessary to change direction of measurement, mark a control point and swing tape at this point. (Note: a flexible steel cable can be used to measure points and main beams only.) Enter fractional figures in eighths, without reduction. Official measurements cannot be taken until antlers have dried for at least 60 days after the animal was killed.

- A. Number of points on each antler: to be counted a point, the projection must be at least one inch long, with the length exceeding width at one inch or more of length. All points are measured from tip of point to nearest edge of beam. Beam tip is counted as a point but not measured as a point.
- B. Tip to tip spread is measured between tips of main beams.
- C. Greatest spread is measured between perpendiculars at a right angle to the center line of the skull at widest part, whether across main beams or points.
- D. Inside spread of main beams is measured at a right angle to the center line of the skull at widest point between main beams. Enter this measurement again as the spread credit if it is less than or equal to the length of longer antler; if longer, enter longer antler length for spread credit.
- E. Total of lengths of all abnormal points: Abnormal points are those nontypical in location (such as points originating from a point or from bottom or sides of main beam) or extra points beyond the normal pattern of points. Measure in usual manner and enter in appropriate blanks.
- F. Length of main beam is measured from lowest outside edge of burr over outer curve to the most distant point of what is, or appears to be, the main beam. The point of beginning is that point on the burr where the center line along the outer curve of the beam intersects the burr, then following generally the outer curve of the main beam to the tip of the beam.
- G. 1-2-3-4-5-6-7 Length of normal points: normal points project from the top of the main beam. They are measured from nearest edge of main beam over outer curve to tip. Lay the tape along the outer curve of the beam so that the top edge of the tape coincides with top edge of the beam on both sides of the point to determine the base line for point measurements. Record point lengths in appropriate blanks.
- H. 1-2-3-4 Circumferences are taken as detailed for each measurement. If brow point is missing, take H-1 and H-2 at smallest place between burr and G-2. If G-4 is missing, take H-4 halfway between G-3 and tip of main beam.

---

### FAIR CHASE STATEMENT FOR ALL HUNTER-TAKEN WHITETAILED DEER

To make use of the following methods shall be deemed as **UNFAIR CHASE** and unsportsmanlike, and any deer obtained by use of such means is disqualified from entry.

- I. Spotting or herding game from the air, followed by landing in its vicinity for pursuit;
- II. Herding or pursuing game with motor-powered vehicles;
- III. Use of electronic communications for attracting, locating or observing game, or guiding the hunter to such game;
- IV. Hunting game confined by artificial barriers, including escape-proof fencing; or hunting game transplanted solely for the purpose of commercial shooting.
- V. Hunting or taking game on lands without permission or consent of landowner.

---

I certify that the whitetailed deer scored on this chart was not taken in **UNFAIR CHASE** as defined above. I further certify that it was taken in full compliance with South Carolina game laws.

Date: \_\_\_\_\_ Signature of Hunter: \_\_\_\_\_

## INSTRUCTIONS FOR MEASURING NON-TYPICAL WHITETAILED DEER

All measurements must be made with a 1/4 inch flexible steel tape to the nearest one-eighth of an inch. Wherever it is necessary to change direction of measurement, mark a control point and swing tape at this point. (Note: a flexible steel cable can be used to measure points and main beams only.) Enter fractional figures in eighths, without reduction. Official measurements cannot be taken until antlers have dried for at least 60 days after the animal was killed.

- A. Number of points on each antler: to be counted a point, the projection must be at least one inch long, with the length exceeding width at one inch or more of length. All points are measured from tip of point to nearest edge of beam. Beam tip is counted as a point but not measured as a point.
- B. Tip to tip spread is measured between tips of main beams.
- C. Greatest spread is measured between perpendiculars at a right angle to the center line of the skull at widest part, whether across main beams or points.
- D. Inside spread of main beams is measured at a right angle to the center line of the skull at widest point between main beams. Enter this measurement again as the spread credit if it is less than or equal to the length of longer antler; if longer, enter longer antler length for spread credit.
- E. Total of lengths of all abnormal points: Abnormal points are those nontypical in location (such as points originating from a point or from bottom or sides of main beam) or extra points beyond the normal pattern of points. Measure in usual manner and enter in appropriate blanks.
