Introduction and Overview

The South Carolina Marine Game Fish Tagging Program is in its 33rd year with the Marine Resources Division of the South Carolina Department of Natural Resources. 2007 marks the third year that the program has operated under the new format, which limits participation to 225 trained taggers. This level of participation has proven successful in making the program more manageable and ultimately seems to provide a greater degree of satisfaction among taggers with regards to their involvement in the fisheries management process. The program continues to focus on promoting the conservation of marine game fish by providing anglers with proof of the benefits of catch and release. Overall, the program is constantly undergoing refinements in order to maintain the integrity of the data that is collected and ensure that participants realize the benefits of their contributions

The principal funding source for the tagging program comes from revenue generated by the sale of the South Carolina Saltwater Recreational Fishing License. An annual funding proposal is submitted each year to the Saltwater Recreational Fishery Advisory Committee outlining the program objectives, goals, and budget. The committee reviews the proposal, discusses the proposed budget, and provides recommendations. Funding for the upcoming year is awarded on July 1. Additional funding comes from the occasional donations made by individuals or fishing clubs which help to further offset program costs.

The program is administered by Robert Wiggers, a fisheries biologist with the Marine Resources Division. Additional support is provided by Ernest Muhammad who assists with data entry and the processing of recaptures.

Select marine finfish species are targeted for tag and release based on their importance both recreationally and commercially to the State and South Atlantic region. The list of target species is further narrowed down based on the amount of historical data on that species with regards to seasonal movements, habitat requirements, growth rates and release mortality.

The following report is a summary of tagging activity during 2006.

Target Species

Target species for 2006 included all species of billfish, tuna, sharks, snapper-grouper and flounder. Other specific species include black drum, bluefish, cobia, king mackerel, red drum (over 18 inches), Spanish mackerel, tarpon, and weakfish (gray trout). Special emphasis was placed on tagging weakfish, and this focused effort will continue.

Angler Awards and Overall Participation

The tagging program presents a Conservation Award to those anglers that tag and release a minimum of 30 eligible fish within a calendar year. In addition to receiving credit for a typical tag and release, anglers also receive credit for a tag and release if they catch a fish that already has a tag (either yellow recreational or orange “DJ”) and release the fish with the tag left intact. **Species less than 12 inches in total length (other than weakfish), non-target species, and red**

drum less than 18 inches are not counted towards the conservation award, although data is still utilized.

In 2006, 25 anglers qualified for conservation awards (Table 1).

Gary DenBraven was the top tagger with 254 fish tagged and released. All of Gary's fish were tagged and released from the Surfside Pier in Myrtle Beach. This represents an outstanding effort from one of the few shore-based anglers participating in the program. The majority of his tagging effort focused on small coastal sharks including Atlantic sharpnose and smooth dogfish. Gary also tagged weakfish, flounder, bluefish, Spanish mackerel and spadefish.

Mike Waller captured the number two top tagger spot by tagging and releasing 223 fish, including sheepshead, red drum, weakfish, bluefish, and bonnethead sharks. A licensed guide, Mike concentrated his tagging effort in areas of the Kiawah River that have historically received little tagging activity.

John Dunphy tagged and released 195 fish to fill the number three top tagger spot. John tagged several species of coastal sharks including bonnetheads, lemon sharks, Atlantic sharpnose, blacktips, and smooth dogfish. In addition, he tagged numerous weakfish and red drum. Most of John's tagging effort was in the southern coastal region of the state (Beaufort County) in areas around St. Helena Sound, Fripp and Pritchards Islands.

Of the 225 trained taggers, 53% tagged at least one fish (Table 2). In comparison, 2005 had fewer trained taggers (152) but a more active group in which 64% tagged at least one fish. An examination of tag usage shows that from 2005 through 2006, 44% of the 7,641 tags issued to program participants have been returned in the form of tag cards detailing the initial tag event. In this respect, the program continues to struggle with the efficient use of tag kits. Other angler-based programs have reported similar results, in which case it may be an unavoidable aspect of conducting a program of this type.

Program Operation and Management

Keeping the number of participants at a manageable level has allowed the program to run more efficiently, improved communication, and provided staff with the means to maintain strict quality control measures.

A total of three tag and release training workshops were held in 2006, one in each coastal region of the state. Anglers wishing to participate in the program were required to attend a workshop before being issued tags and equipment. Once certified, anglers are not required to attend another workshop but must renew their registration each year in order to continue receiving tags; however, experienced taggers are encouraged to attend another workshop. This provides an opportunity to share information and suggestions gained from actual experience tagging and releasing different species. Anglers that express an interest in participating, after the workshop series has been completed, are added to a mailing list to be notified regarding the schedule for the upcoming year. Letters are typically sent out a month prior to the first scheduled workshop, and anglers must pre-register for the workshop they plan to attend. Workshops focus on training anglers the proper techniques used in handling, tagging, venting, and releasing marine game fish in addition to providing an overview of the programs' tag and recapture database. Promoting

resource conservation is also an integral part of the workshop experience. The two hour workshop is divided into two parts; a presentation, followed by “hands-on” tagging where participants have the opportunity to practice tagging on dead fish. The practice tagging proves invaluable in helping anglers to hone their tagging technique before placing a tag in a live fish.

Tagging Equipment

Yellow nylon dart tags have proven to have good tag retention and are relatively easy to apply. Three sizes of tags are used depending on the species and size of fish being tagged. The smallest tags measure 9.5 cm (3.75 in.) and are used on fish between 12 and 27 inches. The next size measures 14.5 cm (5.75 in.) and is used on fish over 27 inches. The largest tag is a stainless steel harpoon tag specifically for tagging sharks and billfish. Unlike dart tags, the harpoon tag is designed to embed in the muscle of the fish as opposed to locking between spines. Applicators for the nylon dart tags are stainless canulas imbedded in a wooden dowel. A stainless slotted tip is provided to anglers for use with the harpoon tag along with instructions for building a tag stick.

Ease of application requiring a minimum amount of instruction, and the low cost, are the primary reasons for utilizing this style of tag.

Each tag has a corresponding postage paid information card where anglers report the necessary information about the tag event. Tagging equipment is shown in Figure 1.

Figure 1. From left to right. Tag applicator, quarter (for scale), slotted tag applicator tip, stainless harpoon tag, 5.75 inch nylon dart tag, 3.75 inch nylon dart tag, and postage paid tag information card for recording data.

2006 Tag and Recapture Data

Compared to 2005 (2,124 fish tagged), 2006 showed a marked increase in tagging activity with 2,917 fish being tagged and released (Table 3). There were 383 recaptures reported between 1 January 2006 and 31 December 2006 (Table 4). Two hundred sixty five (265) of these were re-released with the tag still intact which will allow for the possibility of obtaining additional data points. Only 20% of the recaptures were retained. The practice of releasing tagged fish with the tag still intact is strongly encouraged and heavily promoted among recreational anglers. Multiple recaptures help to better define site fidelity patterns that may exist between different species.

Of the 383 reported recaptures there were 32 that had no associated initial tag information. In instances (351) where days at large could be calculated, 83% of the recaptures occurred within

one year of the initial tag event. The longest time at large for a species recaptured in 2006 was a red drum that was out for 2,705 days (about 7 ½ years). The list of recaptures reported during 2006 is shown in Table 5.

Black Drum

Fifty eight (58) black drum were tagged in 2006. Sixty six percent of black drum tagged were caught in state waters, primarily around the rock jetties at the entrances of Winyah Bay and Charleston Harbor. Fish ranged in size from 10 to 23 inches with an average size of 15.1 inches.

There were 15 recaptures reported. In instances where initial tag information was available, no significant movement was documented and all but one were initially tagged in 2006. This represents an annual recapture rate of 26 percent.

Black Sea Bass

There was a marked increase from 2005 in tagging activity for black sea bass. In 2006, 98 black sea bass were tagged and released, compared to only 10 in 2005. Eighty three percent of these were tagged in Federal waters (beyond 3 miles). The average size tagged and released was 11.5 inches.

Seventeen (17) tagged black sea bass were recaptured. With the exception of one fish (initial tag information was not available) all had been initially tagged within six months of their recapture. Eleven of these fish were re-released with the tag still intact. Multiple short-term recaptures support the notion that these fish are actively feeding after having already been caught, tagged and released. In one particular instance, a fish was recaptured an hour after having been tagged, and then recaptured a second time two months later.

Bluefish

Sixty three (63) bluefish were tagged in 2006 with no recaptures reported. This is the second consecutive year that there have been no tagged bluefish recaptured. The overall recapture rate, as documented through this project, is around 2 percent. Tag retention is considered to be fairly poor considering the possibility that other bluefish may be biting off the tags. The average size tagged and released was 13.2 inches.

Cobia

Eighty four (84) cobia were tagged and released in 2006, 70% of which were caught in the Broad River. This is a significant increase from what was tagged (25) during 2005, and may be representative of an increase in species abundance from 2005 to 2006. According to catch estimates from NMFS Marine Recreational Statistics Survey (MRFSS) from 2003 to 2005 there was a marked decrease in total catch, and although 2006 data is not yet available, total estimated catch may be increasing. Most cobia tagged and released were smaller fish, and those measured at total length (64) averaged 30 inches.

Fourteen (14) cobia were recaptured during 2006. Twelve of these were recaptured in the Broad River during May and June, and with the exception of one fish (no initial tag information available), the majority were recaptured within a few weeks following the initial tag event. In most cases after the recapture (71%), fish were retained, which reflects on a fishery directed more at harvest than release. For 2006, the annual recapture rate was around 13 percent.

As seen in the past, most of these recaptures document the periodic return of fish into the Broad River. One particular fish was originally tagged off Cape Canaveral, Florida on 12 April 2006 before being recaptured in the Broad River on 4 May (20 DAL) (est. distance 280 miles). The fish was recaptured a second time two days later (Broad River) but was released without the tag. Not all cobia show a seasonal northerly movement as evident by a fish tagged off Sebastian Inlet (3/10/2006) which was subsequently recaptured in the same area on 16 July 2006.

Two fish (34 and 24 inches TL), tagged 5/29/2004 and 7/10/2004, in the Broad River and Whitewater Reef, were recaptured in the Broad River (5/5/2006 – 706 DAL) and Port Royal Sound (5/16/2006 – 675 DAL). Both fish were retained.

Flounder

One hundred fourteen (114) flounder were tagged in 2006. Twenty-five were identified as southern, 21 as summer, and 68 were not identified. The greatest numbers of tagged fish occurred in the northern coastal region specifically around Murrells Inlet and Hog Inlet. Average size fish tagged was 13.5 inches.

Nine recaptures were reported, most of which occurred several months after the initial tag event. Only two of the recaptures (Murrells Inlet), tagged 11/11/2005 and 10/29/2005, were at large for a period of more than three months; 209 DAL and 187 DAL respectively, with no documented movement.

King Mackerel

Thirty four (34) king mackerel, ranging in size from 21 to 41 inches, were tagged in 2006. Twenty five were tagged off South Carolina, 8 off Georgia, and 1 off North Carolina.

Only one recapture was reported. A fish tagged in the Gray's Reef Marine Sanctuary (off Georgia) on 26 August was recaptured off Oregon Inlet, North Carolina on 18 October (53 DAL) (est. distance 460 miles). The recapture was reported by a commercial fisherman and the catch was retained. Overall recapture rates for king mackerel have been historically low at around 2 percent.

Red Drum

Tagging effort on red drum during 2006 was similar to that seen in years past. One thousand three hundred thirty seven (1337) fish were tagged ranging in size from 12 to 52 inches with an average size (26.5 inches) almost the same as that tagged in 2005 (26.4 inches). There were 48

fish tagged that were greater than 39 inches. Red drum constituted almost half of the species tagged as part of this project during 2006, with most of the tagging effort focusing in and around the Charleston area.

In the southern coastal region (Beaufort, Colleton counties) the primary areas where red drum were tagged included (number tagged): Trenchard's Inlet/Skull Creek (57), Broad Creek/Old House Creek (49), and Mackay Creek/Skull Creek at Pinckney Island (20). In the central coastal region (Charleston, Berkeley counties): Wando River (248), Charleston Harbor and adjacent areas (141), and the Ashley River (122). Top tagging locations in the northern coastal region (Georgetown, Horry counties) include: Winyah Bay and adjacent areas (76), Sampit River (27), and Apache Pier (10).

Red drum are truly indicative of the program's conservation component, and during 2006 356 fish (27%) were tagged and released that were within the legal slot limit and could have potentially been retained. The recaptures of these fish further provide an example of the value of catch and release.

During 2006 there were 260 reported recaptures of red drum with 89% being re-released. The average days at large was 238 days with the longest time from initial tagging to recapture at 2,705 days (about 7 ½ years). Nineteen fish were recaptured twice during the same year, one of which was recaptured three times. Twenty-four fish were recaptured in Hamlin Creek/ Grey Bay, which is somewhat indicative of the level of fishing pressure this area receives.

In most cases red drum are recaptured within close proximity of the initial tag location which supports strong site fidelity of sub-adult fish. However, in several documented cases of reported recaptures during 2006, there was significant movement.

There were five instances where fish tagged in the Wando River were recaptured in waters adjacent to Sullivans Island. (est. distance 15-25 miles). One other fish (28 inches) was tagged in the Cooper River (8/6/2005) and recaptured in Grey Bay (4/11/2006) (est. distance 14 miles).

Fish tagged 1/25/2005 (T. Bowen) at the mouth of Bank Creek, St. Helena was recaptured 6/25/2006 in the surf off Edisto Beach (506 DAL) (est. distance 15 miles).

Forty-inch fish tagged 11/19/2000 (J. Dunphy) in Old House Creek was recaptured 7/20/2006 near Skull Inlet (2,069 DAL) (est. distance 8 miles).

Fish tagged 9/25/2005 (M. Rankin) at the Georgetown Jetties was recaptured 10/21/2006 in Murrells Inlet (391 DAL) (est. distance 26 miles).

Billfish

A de-emphasizing of (archival) billfish tagging, mainly in the interest of reducing potential tag induced mortality, resulted in only 29 billfish being tagged during 2006. Sixteen (16) sailfish, nine (9) blue marlin, and four (4) white marlin were tagged and released.

Two sailfish were recaptured in 2006, both of which were recaptured off Miami, Florida. One fish was tagged 5/20/2005 (H. Moseley) at the 226 Hole off Georgetown and was recaptured

4/16/2006 (331 DAL) (est. distance 508 miles). The other fish was tagged 6/18/2002 (D. Brookshire) off Charleston and was recaptured 1/22/2006 (1,314 DAL) (est. distance 480 miles). Both fish were re-released; however, the tags were removed.

Sharks

Anglers are encouraged to tag and release sharks provided it can be done safely and the tagger can make a positive identification of the shark they plan to tag. For this reason, it is recommended that certified taggers spend some time referencing shark identification guides, or contact program staff in order to become more familiar with identifying species characteristics.

There was a substantial increase by program participants in directed tagging effort for sharks in 2006. Five hundred four (504) sharks, encompassing a variety of species, were tagged and released, as compared to only 85 tagged and released in 2005. The majority (89%) were small coastal and dogfish species.

Atlantic sharpnose (208) comprised the top species tagged; which is not surprising since they are the most common small coastal shark typically encountered by recreational anglers. Top tagging locations (number tagged) are as follows: Surfside Pier (131), offshore of Kiawah Island (22), and offshore of Charleston Harbor (15). Four Atlantic sharpnose were recaptured which represents a 2% annual recapture rate. All were recaptured in the same general vicinity within a week of the initial tagging event.

There were 123 bonnethead sharks tagged in 2006. Eighty two (82) of these were tagged in the Kiawah River around Mullet Hall and Haulover Creek. Average size of tagged bonnetheads was around 11 pounds. There were five recaptures reported, four of which were initially tagged near Mullet Hall (Kiawah River) and recaptured in the same area with DAL ranging from 29 to 79 days. These recaptures support seasonal site fidelity possibly associated with spawning. One bonnethead tagged 6/2/2005 (J. Dunphy) near St. Phillips Island (Beaufort Cty.) was recaptured 6/20/2006 near Mullet Hall (383 DAL).

One hundred fourteen (114) dogfish (12-spiny, 102-smooth) were tagged and released. Eighty one (81) smooth dogfish were tagged off Surfside Pier, one of which was recaptured six days later off the same pier.

Sheepshead

One hundred thirty three (133) sheepshead were tagged and released during 2006, which is more than twice the number tagged (62) in 2005. Average size tagged was 13.75 inches. Tagging activity occurred primarily from September through December and overall, 83% were tagged in state waters. Top tagging locations (number tagged) included: Kiawah River (75), Capers Reef R-8 (16), and offshore of Edisto Island (6).

Twenty seven (27) sheepshead were reported recaptured during 2006, 67% of which had been tagged within the same year. This represents an annual recapture rate of 14% which is slightly higher than the programs' cumulative rate which is around 12%. The average DAL was 104 days with the longest time at large 1,252 days (about 3 ½ years).

Examination of recapture locations versus initial tag locations reveals the typical site fidelity exhibited by the species with some seasonal movement of fish moving from inshore to slightly offshore as water temperature cools in the late Fall.

Eighteen fish recaptured in areas (boat docks, rock piles) off the Kiawah River were recaptured shortly thereafter in the same general areas. For 2006 the recapture rate for sheepshead tagged in the Kiawah River was around 20%.

Fish tagged at the Murrells Inlet jetties on 11/30/2004 (W. Swann) was recaptured at the Pawleys Island Reef on 1/29/2006 (425 DAL). Another fish tagged on 10/30/2002 (G. Madlinger) near Trenchard's Inlet at Skull Creek was recaptured on 4/5/2006 at the General Gordon Wreck (1,252 DAL).

Snapper-Grouper

Tagging effort on snapper-grouper complex species is primarily focused on undersized fish, and these species typically represent less than 7% of the total number of fish tagged as part of the program. During 2006, 134 snapper-grouper complex species (excluding black sea bass, sheepshead and spadefish) were tagged and released. The top species tagged (number tagged) (average size) were scamp (39) (18.1 inches TL), red porgy (27) (13.2 inches TL), red grouper (21) (17.8 inches TL), and red snapper (13) (17.2 inches TL). Nineteen of these species were tagged off Sebastian Inlet by Ron Rincones, a Florida-based participant, and the one red grouper and one red snapper that were recaptured (initially tagged by R. Rincones) were caught in the same location as where they were initially tagged.

Overall, red snapper and red grouper were the most commonly recaptured species with three recaptures reported for each. As with most snapper-grouper species that are tagged as part of this project, it is difficult to document movement since location information for both the initial tag and recapture event is often generalized (partial coordinates). Anglers may feel that by providing specific location information they are compromising their fishing spot. Regardless, the tag and subsequent recapture of species caught in deep water can provide some insight into post release survival rates.

Two red grouper tagged on 4/13/2006 (W. Dotterer) were recaptured on 10/13/2006 (183 DAL). Both fish were retained.

Two red snapper tagged on 11/20/2004 (D. Harter) were recaptured on 5/28 and 9/4 (554 and 653 DAL respectively).

A gag grouper tagged on 7/23/2005 (E. Heiden) was recaptured on 7/31/2006 (373 DAL).

Spadefish

There were 60 spadefish tagged in 2006 most of which were tagged during June and July. Eighty two percent were caught on the Georgetown Nearshore Reef and ranged in size from 6 ½ to 14 inches with an average size of 11.1 inches.

Sixteen recaptures were reported with only one that had no initial tag information. Of the fifteen with initial tag information, all were tagged in 2006 (25% annual recapture rate). Comparatively, the overall recapture rate over a twenty year period is just 3%. Similar to what has been documented in the past, all the recoveries were short term (average 10 DAL) with no documented movement.

Weakfish

Figure 2. A spotted seatrout (*Cynoscion nebulosus*) (left) and weakfish (*Cynoscion regalis*) (right). Tagging was discontinued on spotted seatrout because of the potential for high tag induced mortality; however, anglers are encouraged to tag weakfish.

In order to gain a better understanding of the weakfish fishery off South Carolina and document the correlation to that of the overall Atlantic coast weakfish stock, a focused tag and release effort was undertaken in 2005.

Compared to 2005 (24 fish tagged) the number of weakfish tagged during 2006 increased significantly. Program participants tagged 172 weakfish using the standard small nylon dart tags and applicator. Program staff supplemented this effort by tagging an additional 241 fish using T-bar anchor tags (Hallprint® Pty.Ltd., South Australia) and a tagging gun featuring a removable stainless steel tagging needle (Avery Dennison Swiftach®). Since weakfish are usually encountered in large schools, and are often caught fairly quickly once located, utilizing this style tag in conjunction with waterproof data sheets (as opposed to recording information on cards) proved to be an efficient means for tagging and releasing a large quantity of fish during a given trip. Tagging equipment is shown in figure 3.

Figure 3. Dennison tag gun with tag strip inserted. Tags come in strips of 50 and T-bar anchor tags (top) measure 1.75 inches. Also shown is a waterproof data sheet for recoding catch information.

Overall, the average size weakfish tagged and released (n=413) was 12.9 inches with a size range between 9 and 21 inches. Surprisingly, the average size fish tagged and released (n=69) from Edisto Beach south was 14.6 inches.

Tagging locations (number tagged) for weakfish, based on the total tagged, were: Surfside Beach (297), Fripp Dry Dock (42), Charleston Nearshore Reef (41), off Port Royal Sound (20), off Edisto Beach (7), Folly Creek (3), Broad Creek (2), Kiawah River (1).

Figure 4. A “depth-finder view” showing the trailing edge of a large school of weakfish encountered off Surfside Beach. Just before this photo was taken, the school filled the screen.

Three weakfish were recaptured, one fish, tagged with a T-Bar anchor tag, was recaptured ten minutes after having been tagged.

Fish tagged 9/29/2006 (M. Waller) in the Kiawah River was recaptured in the same area on 10/19/2006 (20 DAL). The fish was released with tag intact.

Fish tagged 9/29/2006 (R. Wiggers) off Surfside Beach was recaptured approximately ¼ mile south on 10/11/2006 (12 DAL). The fish was retained.

Acknowledgements

Program staff would like to thank the 225 certified taggers that have contributed to this project. We appreciate the time that you have taken to tag fish and actively participate in the conservation of the State's marine resources.

Thanks to The Saltwater Sports Club of James Island for their donation in 2006. This club has donated funds to the Marine Game Fish Tagging Program every year for more than a decade.

Thanks to Ernest Muhammad (data compilation), Karen Wiggers (editing), and Karen Swanson (formatting) for their help in putting this report together.
